

# Small but mighty

Attachments, light machines add functionality, accuracy

By Jeff Zagoudis  
Associate Editor

The secret to doing any job is having the right tools available. Construction equipment attachments and other pieces of light equipment give operators many of those tools that they would not have otherwise.

Versatility and multifunctionality are prominent features of various attachments and other light equipment, making them the right tool for multiple jobs. Terex's G-Series mulcher attachment gives its compact track loader the ability to cut and mulch trees in addition

to mowing. The V3 FlexPlane landscaping blade can be used as a standard, rigid blade or contoured to the surrounding landscape.

The other benefit of attachments and light equipment is the ability to work in smaller spaces with greater accuracy. E-Z Drill's EQ MT concrete drill models feature a side-shift control panel so operators can reposition the drill more precisely from the ground. Brokk AB's Brokk 100 demolition machine provides greater breaking power and stands less than 4 ft tall. **R&B**

## Getting a grip

There are no hydraulic hookups on Kenco's New Generation (NG) Barrier Lift. The attachment automatically closes around the target barrier and doesn't open until the barrier is set in place. The grip is strong even in wet weather thanks to 33% wider elastomer pads. It can handle any type of concrete median barrier, sound wall or curbing and piling thanks to a 6- to 12-in. variable grip range. Self-aligning guides are optional for all models. **Write in 900**

## Double duty

Created for Terex's PT-100G Forestry compact track loader, the G-Series mulcher attachment uses a two-stage process to handle any tree up to 8 in. in diameter. Twin carbide teeth chew up the initial load, which is then processed into fine mulch particles and discharged. For jobs requiring an extra-fine mulch, an optional primary stage shear bar is available. The attachment also can be used for clearing brush and mowing grass and weeds. Two different motor options are available. **Write in 901**

## More compact(ion)

A variety of attachments make up Atlas Copco's newest line of light compaction equipment. LT series tampers were designed for granular and cohesive soils, featuring a low-emission, low-noise Honda four-stroke engine and multifunctional fuel tank. LF forward plates are meant for small repair and maintenance work with granular soils and asphalt, while the forward-reversible LG (gear) and LH (hydraulic) plates offer an alternative to rollers. The LP series of walk-behind duplex rollers and trench compactors are ideal for compaction in small, confined spaces. **Write in 902**

For more information on this equipment, see the reader service form on p 74.
